

Sapling Aftercare Instructions

Dear Parent or Guardian,

Today your child learned about how trees are grown and harvested for the making of paper and then turned into packaging materials that are recyclable and renewable. As part of this programme, your child was also provided with a sapling that they planted into a cardboard carton. 'The sapling is a Norway spruce, native to Northern, Central and Eastern Europe. It has branchlets that typically hang downwards with large cones that can grow to 9–17cm in length. You may also recognise this as a festive (Christmas) tree'. May you enjoy watching this tree grow for years to come!

1. If your carton planter does not already have holes in it, make a few cuts in the bottom and sides of the carton with a knife.
2. Water the sapling and then ideally, place the sapling in a protected area out of the wind or sun for a few days to harden it off.
3. Select an appropriate location outside with enough space to contain what will become a mature tree. If you do not have room outside to plant a tree, you can plant it in a large bucket or decorative pot.
4. To avoid drying out the root hairs, it's best not to plant the sapling on a bright sunny day, transplant the seedling and carton on an overcast day or alternatively plant it in late afternoon or early evening when the sun has gone down.
5. Dig a hole in the ground large enough to contain the carton.
6. Place the carton in the hole with about one inch of the carton projecting above ground and lightly pile the soil up around the carton. The sides of the carton will force the water down into the soil and the roots will follow through the bottom of the carton.
7. To start, water the sapling with about a litre of water once a week. Add a day between waterings as the roots grow deeper.
8. Eventually the carton will decompose, leaving a growing tree.
